

Customer Journey Map

Project: Script-Controlled ACL – Restrict Record Access Based on Field Value

Date: 26/09/2026 **Team ID:** SWTID-2026-7464

Scenario: A user attempts to access a record while the system evaluates a field value through a script-controlled ACL and either grants or restricts access.

Steps / Experience	1. Identify Record	2. Request Access	3. Evaluate Field Value	4. Grant / Restrict Access	5. Verify & Troubleshoot	6. Ongoing Use
Interactions	User opens the application and selects a record.	User opens or requests the selected record.	ACL script reads the relevant field value and evaluates the access condition.	System allows access when the condition is satisfied or restricts it when it is not.	Administrator tests different users and field values to confirm the ACL behaves as intended.	Users continue working with records while administrators maintain the ACL.
Things	Application UI; record list; browser	Record page; access request/action	ACL script; record field; user/session context	Allow/deny response; record visibility	Test records; scripts; logs/documentation	Application; ACL configuration; documentation
Places	Application / record page	Application interface	Server/application security layer	Application record page	Development/admin environment	Production application/admin environment
People	User; application	User; application	ACL logic; current user context	User; application security layer	Administrator; developer; tester	Users; administrators
Positive Moments	Find the required record quickly.	The access request is straightforward.	The rule evaluates consistently.	Authorized record becomes available.	Test results clearly confirm the rule.	Access remains consistent as records change.
Negative Moments	Record is easy to locate.	Access is denied without a clear reason.	Unexpected or missing field values can cause uncertainty.	Unauthorized record remains inaccessible.	Debugging can be time-consuming when conditions are unclear.	Changes to field values or requirements may require ACL updates.
Areas of Opportunity	Records may contain different field values and access conditions.	Explain or surface an appropriate access outcome.	Validate field values and define clear fallback behaviour.	Make the access decision predictable and secure.	Provide repeatable test cases and clear documentation.	Make the rule reusable, maintainable, and auditable.
Goals & Motivations	Help me find the record I need without unnecessary navigation.	Help me access the record I am authorized to use.	Help me ensure access is based on the correct field value.	Help me see only records I am permitted to access.	Help me verify that the ACL works correctly in different scenarios.	Help me maintain secure access as requirements evolve.

Reference basis: the uploaded example organizes a journey around steps and interactions, digital/physical touchpoints, places, people, positive and negative moments, opportunities, and goals/motivations. ■filecite■turn3file0■L3-L27■
