

Problem – Solution Fit Template

Date: 15 February 2025 **Team ID:** SWTID-2026-7464 **Project Name:** Script-Controlled ACL – Restrict Record Access Based on Field Value **Maximum Marks:** 2 Marks

Problem – Solution Fit:

The template describes Problem–Solution Fit as finding a customer problem and confirming that the realized solution actually solves that problem. For this project, the fit is represented by connecting the record-access problem, existing access-control behavior, the field-value ACL solution, and the expected user/admin outcome.

1. Customer / Target Group	2. Problem / Pain	3. Existing Situation / Behavior
Application users who need access to records, and administrators responsible for configuring and maintaining access controls.	Record access may need to depend on a value stored inside the record. A static or overly broad access rule can fail to represent this data-dependent requirement, creating a need for more precise record-level restriction.	Users request records through the application. Administrators configure access controls and must test how different record values affect access. The project focuses on improving this existing access-control situation rather than introducing a separate user workflow.
4. Proposed Solution	5. Problem–Solution Fit	6. Expected Customer / User Outcome
Use a script-controlled ACL that evaluates a selected record field value during access authorization. The script compares the value with a configured condition and returns an allow/deny decision.	The solution directly addresses the stated problem because the field value becomes an explicit input to the authorization decision. Matching values can satisfy the access condition, while non-matching values can be restricted.	Authorized users receive access to records that satisfy the configured condition, while restricted records are blocked. Administrators gain a configurable and testable mechanism for field-based record access.
7. Adoption / Existing Medium or Channel	8. Triggers / Frequent Annoyances	9. Improvement / Validation Focus

Use the existing application and access-control mechanism through the platform's ACL configuration and record-access flow. No separate customer channel is required for the core solution.	A record contains a field value that should change whether it is accessible. Typical triggers include a mismatch between the record value and the permitted condition, missing/empty values, or a change in business access rules.	Validate the fit using representative field values and user contexts. Test matching, non-matching, missing, empty, and unexpected values, and verify that the resulting access behavior matches the intended requirement.

Problem–Solution Fit Check

Paragraph('caseSensitive': 1 'encoding': 'utf8' 'text': 'Fit Check' 'frags': [ParaFrag(__tag__='para', bold=1, fontName='Helvetica-Bold', fontSize=7.3, greek=0, italic=0, link=[], rise=0, text='Fit Check', textColor=Color(0,0,0,1), us_lines=[])] 'style': 'bulletText': None 'debug': 0) #Paragraph	Paragraph('caseSensitive': 1 'encoding': 'utf8' 'text': 'Project-specific evidence / validation' 'frags': [ParaFrag(__tag__='para', bold=1, fontName='Helvetica-Bold', fontSize=7.3, greek=0, italic=0, link=[], rise=0, text='Project-specific evidence / validation', textColor=Color(0,0,0,1), us_lines=[])] 'style': 'bulletText': None 'debug': 0) #Paragraph
Problem is relevant	The access requirement is tied to record data, so field-level values can materially affect whether a record should be accessible.
Solution addresses the problem	The ACL script evaluates the relevant field value before access is granted or denied.
Behavioral fit	The solution works within the existing record-access and ACL configuration flow rather than requiring users to learn a separate access mechanism.
Customer outcome	Users receive access when the configured condition is satisfied; administrators can configure and test the rule.
Validation needed	Test real representative records, field values, user contexts, and edge cases to confirm that the implemented rule produces the intended access behavior.

Template alignment: The uploaded template defines Problem–Solution Fit as confirming that a customer problem and the proposed solution fit together, and its stated purposes include understanding the existing situation, solving problems in a way that fits customers, using existing behavior/channels, improving adoption, and building trust. The source does not provide fixed field labels for the blank “Template” area, so the canvas above is a project-specific organization of those stated purposes rather than a reproduction of unspecified fields. ■filecite■turn9file0■L8-L21■
