

Proposed Solution Template

Date: 15 February 2025 **Team ID:** SWTID-2026-7464 **Project Name:** Script-Controlled ACL – Restrict Record Access Based on Field Value **Maximum Marks:** 2 Marks

Proposed Solution Template:

The following project-specific information is structured according to the six parameters in the uploaded template.

S.No.	Parameter	Description
1	Problem Statement (Problem to be solved)	Users and administrators need record-level access to be restricted dynamically based on a specific field value. A static permission rule may not be sufficient when access depends on the data contained in each record. The solution must prevent unauthorized users from viewing records when the configured field condition is not satisfied.
2	Idea / Solution description	Implement a script-controlled Access Control List (ACL) that evaluates a selected record field at access time. The ACL script checks the field value against a configured condition and, where applicable, the user's access context. If the condition matches, the record access request is allowed; otherwise, access is denied. Administrators can configure, test, and maintain the field-based rule.
3	Novelty / Uniqueness	The solution makes the record's own field value an explicit input to the authorization decision. This provides a reusable pattern for data-driven access control, allowing the same approach to be adapted to different fields, values, record types, and business access conditions without creating a separate access rule for every individual record.
4	Social Impact / Customer Satisfaction	The solution supports safer handling of records by limiting visibility according to defined business access conditions. For users, relevant records remain accessible when authorized while restricted records are blocked. For administrators, the rule provides a clear and testable mechanism for managing record-level access.
5	Business Model (Revenue Model)	The core solution is an enterprise access-control capability rather than a standalone consumer product. Potential value can be realized through implementation, configuration, customization, maintenance, training, and managed-service engagements for organizations using the platform. The uploaded template does not prescribe a specific pricing model.
6	Scalability of the Solution	The field-based ACL pattern can be extended to multiple tables, fields, field values, user contexts, and access conditions. Reusable script patterns and standardized testing can support additional access-control rules as the application grows. The solution can also be integrated with broader role- and permission-based controls where required.

Template alignment: The uploaded source specifies the Proposed Solution Template with the six parameters shown above: problem statement, idea/solution description, novelty/uniqueness, social impact/customer satisfaction, business model, and scalability. ■filecite■turn8file0■L8-L17■
