

Project Development Phase

Performance Test – Tableau

Date: 10 February 2025 Team ID: PNT2022TMIDxxxxxx

Project Name: Script-Controlled ACL – Restrict Record Access Based on Field Value

Model Performance Testing: Project team shall fill the following information in the model performance testing template.

S.No.	Parameter	Screenshot / Values
1	Data Rendered	ServiceNow record data rendered for the access-control test scenario. Verify that records and the target field values are available for evaluation.
2	Data Preprocessing	Validate the target field value and user/access context before ACL evaluation. Handle missing, empty, invalid, or unexpected field values according to the configured rule.
3	Utilization of Filters	Use field-value conditions and user/access context as the effective filters for the ACL decision. Record-level access is allowed or restricted based on the configured condition.
4	Calculation fields Used	No Tableau-style calculated field is required for the core ACL solution. The equivalent decision logic is implemented in the ServiceNow ACL script to evaluate the target field value.
5	Dashboard design – No. of Visualizations / Graphs	Not applicable to the core ACL implementation. For validation, an optional monitoring view may summarize Allow/Deny outcomes, field-value test cases, and validation results.
6	Story Design – No. of Visualizations / Graphs	Not applicable to the core ACL implementation. If used for demonstration, a simple story can show the access request → field evaluation → Allow/Deny → validation flow.

Project-specific note: The supplied template is a performance-testing form organized around data rendered, preprocessing, filters, calculation fields, dashboard design, and story design. For this ACL project, the values above map those fields to record-access evaluation and validation rather than a Tableau visualization implementation.
