

Project Development Phase

Model Performance Test – Artificial Intelligence

Date: 10 February 2025 Team ID: PNT2022TMIDxxxxxx

Project Name: Script-Controlled ACL – Restrict Record Access Based on Field Value

Model Performance Testing: Project team shall fill the following information in model performance testing template.

S.No.	Parameter	Values	Screenshot
1	Model Summary	No separate Artificial Intelligence / Machine Learning model is required for the core solution. The access decision is produced by a ServiceNow ACL script that evaluates the configured record field value and access context.	N/A – rule/script execution can be evidenced with test results or screenshots of ACL configuration and access outcomes.
2	Accuracy – Training Accuracy	Not applicable. This solution uses deterministic ACL logic rather than a trained predictive model.	N/A
	Validation Accuracy	Not applicable. Validation is performed through functional test cases covering matching, non-matching, missing, empty, invalid, and unexpected field values.	Test-case evidence / access-result screenshots
3	Fine Tuning Result (if Done)	Not applicable to the core solution. Improvement is performed by refining the ACL script, field condition, validation handling, and test cases rather than by model fine-tuning.	N/A – configuration/version evidence if changes are made
	Validation Accuracy	Not applicable as an AI-model metric. Validation success should be measured by whether expected Allow/Deny outcomes match the configured field-value conditions across the defined test cases.	Validation test evidence

Project-specific note: The supplied template is structured for AI/model performance metrics such as model summary, training accuracy, validation accuracy, and fine-tuning. For this project, those metrics are marked not applicable because the proposed ACL solution is rule/script-based rather than a trained AI model.
