

Project Development Phase

Model Performance Test – Machine Learning

Date: 10 February 2025 Team ID: PNT2022TMIDxxxxxx

Project Name: Script-Controlled ACL – Restrict Record Access Based on Field Value

Model Performance Testing: Project team shall fill the following information in model performance testing template.

S.No.	Parameter	Values	Screenshot
1	Metrics – Regression Model	Not applicable. The core solution is not a regression model; it uses deterministic ACL script logic to evaluate a record field value.	N/A
	MAE / MSE / RMSE / R ² Score	MAE – N/A MSE – N/A RMSE – N/A R ² Score – N/A	N/A
	Classification Model	Not applicable. The core solution does not train a classification model. Access is determined by the configured field-value condition.	N/A
	Confusion Matrix / Accuracy Score / Classification Report	Confusion Matrix – N/A; Accuracy Score – N/A; Classification Report – N/A. Functional validation should instead compare expected Allow/Deny outcomes with actual ACL results.	Test-case evidence can be attached here.
2	Tune the Model – Hyperparameter Tuning	Not applicable. There is no trained ML model or hyperparameter set in the proposed ACL solution. Improvements are made by refining ACL conditions, script logic, validation, and test cases.	N/A
	Validation Method	Rule-based functional validation: test matching and non-matching field values, missing/empty values, invalid/unexpected values, and relevant user/access contexts; verify that each actual result matches the expected Allow/Deny outcome.	Validation screenshots / test results

Project-specific note: The supplied Machine Learning template requests regression/classification metrics, hyperparameter tuning, and validation method. For this project, ML metrics and tuning are marked not applicable because the proposed solution is a script-controlled, rule-based ACL rather than a trained machine-learning model.
